Rating Chart Supplemental Data

The following guidelines should be referred to when interpreting the load rating charts.

- Rated loads included in the charts are the maximum allowable freely suspended loads at a given boom length, boom angle and load radius, and have been determined for the machine standing level on firm supporting surface under ideal operating conditions. The user must limit or de-rate rated loads to allow for adverse conditions (such as soft or uneven ground, out-of-level conditions, wind, side loads, pendulum action, jerking or sudden stopping of loads, inexperience of personnel, multiple machine lifts, and traveling with a load).
- Capacities do not exceed 75% of minimum tipping loads. Capacities based on factors other than machine stability such as structural competence are shown by **asterisk*** in the charts.
- The machine must be reeved and set-up as stated in the Operator's Manual and all the instruction manuals. If these manuals are missing, obtain replacements.
 - Boom backstops and jib backstops are required for all boom lengths.
 - Gantry must be in the fully raised position for all operations.
 - The crane must be leveled to within 1% on a firm supporting surface.
- Do not attempt to lift a load where no radius on load chart is listed as crane may tip or collapse.
- Attempting to lift more than rated loads may cause machine to tip or collapse. Do not tip machine to determine capacity.
- Weight of hooks, hook blocks, slings and other lifting devices are a part of the total load. Their total weight must be subtracted from the rated load to obtain the weight that can be lifted.
- When lifting over jib point with auxiliary sheave or pin connected boom point sheave attached, rated loads for the jib and sheave must be deducted as shown below.

	Auxiliary Sheave	Pin Connected Boom point sheave
Deduction (lbs)	850	480

- The total load that can be lifted over a jib is limited by the rated jib loads.
- The total load that can be lifted over an auxiliary sheave is the value 850 lbs deducted from rated load for the jib without auxiliary sheave, but it should not exceed 25,000 lbs.

- The boom should be erected over the front of the crawlers, not laterally. When erecting and lowering a boom length of 85 ft (25.9 m) and over, the blocks for erection must be placed at the end of the crawlers in front of the idler wheel.
- Least stable position is over the side.
- Maximum number of reeving parts of lines for hoist rope
